

Shell-Colorizer

Automated Bash Terminal Directory Color Customizer

Language: Python 3

Target: Bash / Linux / macOS / Termux

Version: 1.0.0

Overview

Shell-Colorizer is a lightweight Python utility script that configures your Unix/Linux/Termux terminal environment to display directory names in **Bright & Bold Green** when running the `ls` command.

Features

- **Automated Configuration:** Automatically targets user shell profile (`~/.bashrc`).
- **Color Auto-Alias:** Aliases `ls` to `ls --color=auto` so color highlighting occurs seamlessly.
- **Conflict Prevention:** Ensures duplicate or conflicting color rules are replaced cleanly.

⚠ Important Usage Caution:

This script opens `~/.bashrc` in write mode (`'w'`), which **overwrites existing contents** of your `~/.bashrc` file. If you have existing aliases or environment variables, make sure to back up your `.bashrc` file before running.

Installation & Usage

1. Prerequisites

Ensure Python 3 is installed on your system:

```
python3 --version
```

2. Running the Script

Execute the Python script in your terminal:

```
python3 Shell-Colorizer.py
```

3. Apply Changes

Exit from Termux, re-open Termux, and type this command to verify the color changes:

```
ls
```
